

Essential Ocean Variable (EOV): Nitrous Oxide (N₂O)

Background and Justification

Nitrous oxide (N₂O) is an important climate-relevant trace gas in the Earth's atmosphere. In the troposphere it acts as a strong greenhouse gas and in the stratosphere it acts as an ozone depleting substance because it is the precursor of ozone depleting nitric oxide radicals. Because of the on-going decline of chlorofluorocarbons and the continuous increase of N₂O in the atmosphere the contributions of N₂O to both the greenhouse effect and ozone depletion will be even more pronounced in the 21st century. The oceans - including its coastal areas such as continental shelves, estuaries and upwelling areas - are a major source of N₂O and contribute about 30% to the atmospheric N₂O budget. Oceanic N₂O is mainly produced as a by-product during archaeal nitrification (i.e. ammonium oxidation to nitrate) whereas bacterial nitrification seems to be of minor importance as source of oceanic N₂O. N₂O occurs also as an intermediate during microbial denitrification (nitrate reduction via N₂O to dinitrogen, N₂). Nitrification is the dominating N₂O production process, whereas denitrification contributes only 7-35% to the overall N₂O water column budget in the ocean. The amount of N₂O produced during both nitrification and denitrification strongly depends on the prevailing dissolved oxygen (O₂) concentrations and is significantly enhanced under low (i.e. suboxic) O₂ conditions. N₂O is usually not detectable in anoxic waters because of its reduction to N₂ during denitrification. Thus, significantly enhanced N₂O concentrations are generally found at oxic/suboxic or oxic/anoxic boundaries. The strong O₂ sensitivity of N₂O production is also observed in coastal areas characterised by seasonal shifts in the O₂ regime. A biological source of N₂O in the well-oxygenated mixed layer/euphotic zone seems to be unlikely. Global maps of N₂O in the surface ocean show enhanced N₂O anomalies (i.e. supersaturation of N₂O) in equatorial upwelling regions as well as N₂O anomalies close to zero (i.e. near equilibrium) in large parts of the open ocean. The MEMENTO (The Marine Methane and Nitrous Oxide database: <https://memento.geomar.de>) project has been launched with the aim to collect and archive N₂O data sets and to provide actual fields of surface N₂O for emission estimates.

Table 1: EOV Information

Name of EOV	Nitrous Oxide (N ₂ O)
Sub-Variables	Not applicable
Derived Products	Global N ₂ O concentration fields, Global Ocean N ₂ O emission estimates
Supporting variables	Temperature (T), Salinity (S), Atmospheric pressure
Contact/Lead Expert(s)	Hermann Bange (GEOMAR, Germany) and Sam Wilson (University of Hawaii, USA) are Co-chairs of SCOR WG143 'Dissolved N ₂ O and CH ₄ measurements: Working towards a global network of ocean time series measurements of N ₂ O and CH ₄ '

The Global Ocean Observing System (GOOS) is a permanent global system for observations, modelling and analysis of marine and ocean variables to support operational ocean services worldwide. GOOS provides accurate descriptions of the present state of the oceans, continuous forecasts of the future conditions of the sea.

International Council for Science

Table 2: Requirements Setting				
Responsible GOOS Panel	Biogeochemistry Panel			
Societal Drivers	1. The role of ocean biogeochemistry in climate 2. Human impacts on ocean biogeochemistry 3. Ocean ecosystem health			
Scientific Application(s)	Q 1.2. How does the ocean influence cycles of non-CO ₂ greenhouse gases? Q 2.1. How large are the ocean's "dead zones" and how fast are they changing? Q 3.2. How do the eutrophication and pollution impact ocean productivity and water quality?			
Readiness Level	Mature			
Phenomena to Capture	1 Changes in storage of O ₂	2 Eutrophication	3 Upwelling	4 Flux of N ₂ O to the atmosphere
Temporal Scales of the Phenomena	Seasonal to decadal	Seasonal to decadal	Seasonal to perennial	
Spatial Scales of the Phenomena	<u>Coastal</u> 1-500 km <u>Open Ocean</u> <2000 km	<u>Coastal</u> 1-500 km <u>Open Ocean</u> <2000 km	<u>Coastal</u> 1-500 km <u>Open Ocean</u> <2000 km	
Magnitudes/Range of the signal	Decrease of ~1 μM O ₂ year ⁻¹	Increase of ~1 μM N year ⁻¹	Change in SST of >2°C	
Desired Detection Limit Relative to the Signal	?	?	?	

The Global Ocean Observation System (GOOS) is a permanent global system for observations, modelling and analysis of marine and ocean variables to support operational ocean services worldwide. GOOS provides accurate descriptions of the present state of the oceans, continuous forecasts of the future conditions of the sea,.

List of abbreviations

EOV – Essential Ocean Variable
 GOOS – Global Ocean Observing System
 IOCCP – International Ocean Carbon Coordination Project
 FOO – Framework for Ocean Observing
 N₂O – Nitrous Oxide
 CH₄ – Methane
 MEMENTO – The MarinE MethanE and NiTrous Oxide
 SCOR – Scientific Committee on Oceanic Research
 WG – Working Group
 T – Temperature
 S – Salinity
 SST – Sea Surface Temperature
 GC – Gas chromatography
 ECD – Electron capture detector
 NOAA – National Oceanic and Atmospheric Administration
 SH – Ship-based Hydrography
 STS – Ship-based Time-Series
 SOO – Ship Of Opportunity
