

Essential Ocean Variable (EOV): Nutrients

Background and Justification

The availability of inorganic macronutrients (nitrate (NO_3), phosphate (PO_4), silicic acid ($\text{Si}(\text{OH})_4$), ammonium (NH_4), nitrite (NO_2)) in the upper ocean frequently limits and regulates the amount of organic carbon fixed by phytoplankton, thereby constituting a key control mechanism of carbon and biogeochemical cycling. There is a number of biogeographic regions in the open ocean characterized by different macronutrient regimes, either permanently or seasonally limiting the growth of phytoplankton. Measuring changes in macronutrient concentrations is essential to constraining net biological production and export fluxes, detecting shifts in biogeographic regimes, but also monitoring eutrophication phenomena.

For the glossary of terms and list of abbreviations please see the back of the document.

Table 1: EOV Information	
Name of EOV	Nutrients
Sub-Variables	Nitrate (NO_3^-), Nitrite (NO_2^-), Ammonium (NH_4), Phosphate (PO_4), Silicic acid ($\text{Si}(\text{OH})_4$)
Derived Products	Quasi-conservative tracers such as preformed nitrate (N^*) and NO etc.,
Supporting Variables	Surface and subsurface temperature, Surface and subsurface Salinity, Oxygen, Transient Tracers
Responsible GOOS Panel	GOOS Biogeochemistry Panel Contact: ioccp@ioccp.org

The Global Ocean Observation System (GOOS) is a permanent global system for observations, modelling and analysis of marine and ocean variables to support operational ocean services worldwide. GOOS provides accurate descriptions of the present state of the ocean and continuous forecasts of the future conditions of the sea.

International Council for Science

Table 2a: Requirements Setting				
Societal Drivers	1. The role of ocean biogeochemistry in climate 2. Human impacts on ocean biogeochemistry 3. Ocean ecosystem health			
Scientific Application(s)	Q 1.1. How is the ocean carbon content changing? Q 2.1. How large are the ocean's "dead zones" and how fast are they changing? Q 3.1. Is the biomass of the ocean changing? Q 3.2. How do the eutrophication and pollution impact ocean productivity and water quality?			
Readiness Level <i>[as defined in the FOO]</i>	Mature			
Phenomena to Capture	1 Ventilation	2 Remineralization	3 Primary production	4 Eutrophication
Temporal Scales of the Phenomena	Annual to decadal		Seasonal to decadal	Sub-weekly to decadal
Spatial Scales of the Phenomena	1000-3000 km		Coastal 0.1-100 km Open Ocean 100-1000 km	Coastal 0.1-100 km
Magnitudes/Range of the Signal to Capture			0.5 Pg C year ⁻¹ decade ⁻¹ (net community production)	a few %
Current Uncertainty Relative to the Signal				
Target Uncertainty Relative to the Signal				

The Global Ocean Observation System (GOOS) is a permanent global system for observations, modelling and analysis of marine and ocean variables to support operational ocean services worldwide. GOOS provides accurate descriptions of the present state of the ocean and continuous forecasts of the future conditions of the sea.

Glossary of terms

A **Framework for Ocean Observing (FOO)** is a guide for the ocean observing community to establish an integrated and sustained global observing system that addresses the variables to be measured, the approach to measuring them, and how their data and products will be managed and made widely available. FOO is available from: <http://www.ioccp.org/index.php/foo>

A **GOOS Essential Ocean Variable** is a sustained measurement or a group of measurements necessary to assess state and change at a global level, and to increase societal benefits from the ocean [on scales from global to regional].

Sub-variables are components of the EOVS that may be measured, derived or inferred from other elements of the observing system and used to estimate the desired EOVS.

Supporting variables are other EOVS or other measurements from the observing system that may be needed to deliver the sub-variables and/or derived products of the EOVS.

Derived products are calculated from the EOVS and other relevant information, in response to user needs.

A **phenomenon** is an observed process, event, or property, with characteristic spatial and time scale(s), measured or derived from one or a combination of EOVS, and needed to answer at least one of the GOOS Scientific Questions.

A **footprint** is here defined as the area over which given EOVS measurements performed by a single observing element (as a transect, station, track, etc.) are representative of a broader region.

List of abbreviations

EOVS – Essential Ocean Variable

GOOS – Global Ocean Observing System
