**Abstract** – The ocean absorbs a quarter of the global CO<sub>2</sub> (carbon dioxide) emissions from human activity<sup>c</sup>. The community-led Surface Ocean CO<sub>2</sub> Atlas ([www.socat.info](http://www.socat.info)) is key for the quantification of ocean CO<sub>2</sub> uptake and its variation, now and in the future. SOCAT version 2022 has quality-controlled *in situ* surface ocean *f*CO<sub>2</sub> (fugacity of CO<sub>2</sub>) measurements made on ships, moorings, autonomous and drifting surface platforms for the global ocean and coastal seas from 1957 to 2021. The main SOCAT synthesis and gridded products contain 33.7 million *f*CO<sub>2</sub> values with an estimated accuracy of < 5 μatm. A further 6.4 million *f*CO<sub>2</sub> sensor data with an accuracy of 5 to 10 μatm are separately available. SOCAT is used for quantification of ocean CO<sub>2</sub> uptake and ocean acidification and for evaluation of climate models and sensor data. The SOCAT synthesis products are a crucial step in the value chain based on *in situ* inorganic carbon measurements of the ocean<sup>e</sup>, which provides policy makers with vital information in climate negotiations. The need for accurate knowledge of global ocean CO<sub>2</sub> uptake and its variation makes sustained funding of *in situ* surface ocean CO<sub>2</sub> observations and their synthesis imperative.

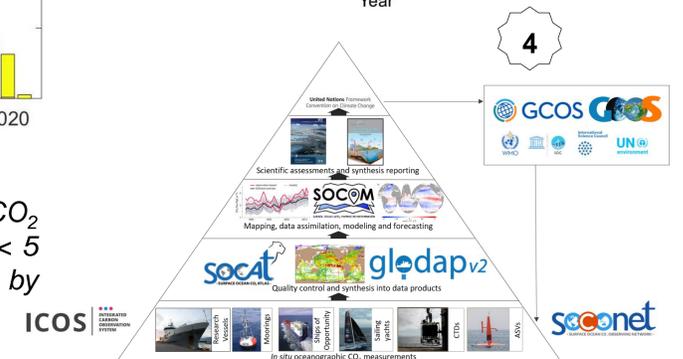

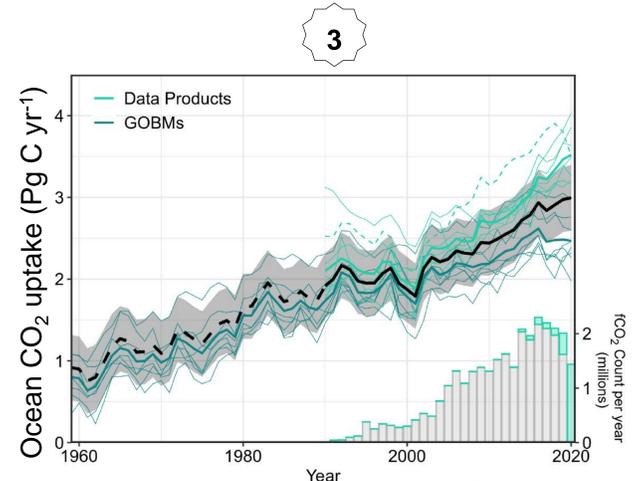

**Fig. 1.** *In situ* surface ocean *f*CO<sub>2</sub> values (colour coded, μatm) with an estimated accuracy of a) < 5 μatm and b) 5 - 10 μatm in version 2022. Squares indicate moorings. The main synthesis and gridded products contain *f*CO<sub>2</sub> values in Fig. 1a. The *f*CO<sub>2</sub> values in Fig. 1b are separately available.

**Fig. 2.** Number of surface ocean *f*CO<sub>2</sub> values with an estimated accuracy of a) < 5 μatm and b) 5 - 10 μatm for each year by SOCAT version.

**Fig. 3.** Ocean CO<sub>2</sub> uptake in the 2021 Global Carbon Budget<sup>c</sup>. Cyan lines for SOCAT-based estimates. Darker sea-green lines for model results. From<sup>c</sup>.

**Fig. 4.** The value chain based on *in situ* inorganic carbon measurements of the ocean. Modified from<sup>e</sup>.

## Key features of SOCATv2022

- *In situ* surface ocean *f*CO<sub>2</sub> measurements on ships, moorings, autonomous and drifting surface platforms for the global ocean and coastal seas from 1957 to 2021
- 33.7 million good quality *f*CO<sub>2</sub> values with an accuracy of < 5 μatm in the main synthesis and gridded products (Fig. 1a & 2a)
- 6.4 million *f*CO<sub>2</sub> values with an accuracy of 5 - 10 μatm, mainly from sensors, are available separately (Fig. 1b & 2b).
- Community-led quality-control (QC) and synthesis
- Annual, public release
- Online viewers and data download ([www.socat.info](http://www.socat.info))

## Outlook

- v2023 data submission by 16/01/2023, QC by 31/03/2023
- Fragile, short-term funding

## Scientific findings, applications and impact

- Quantification of ocean CO<sub>2</sub> uptake<sup>b,c,f,h,i,k,l</sup> and acidification<sup>d,g,j</sup>
- Evaluation of models<sup>a</sup> and sensor data<sup>m</sup>
- Data gaps in time and space addressed through advanced interpolation schemes<sup>d,g,h,i,k,l</sup>
- Year-to-year and decadal variation in ocean CO<sub>2</sub> uptake<sup>l</sup>
- Models underestimate variation in ocean CO<sub>2</sub> uptake<sup>l</sup>
- Cited in hundreds of peer-reviewed scientific articles and reports
- Critical policy info from value chain<sup>e</sup>
- Contribution to UN Decade of Ocean Science for Sustainable Development and SDGs 13 and 14 (#OceanAction20464)

## Outlook (cont.)

- Automation of metadata upload
- Component of a SDG 14.3 federated data system

**Data Use:** To generously acknowledge the contribution of SOCAT scientists by invitation to co-authorship, especially for key data providers in regional studies, and/or reference to relevant scientific articles. **Acknowledgements:** We thank the numerous contributors, funding agencies, IOCCP, SOLAS and IMBER. **Documentation v3-v2022:** Bakker et al.
